

LATEX ALLERGY WARNING

It is estimated that 1% of the U.S. population is allergic to latex. People who are exposed to latex on a daily basis, the figure is estimated to be as high as 8%. The issue of allergic reactions to latex has intensified in recent years and has created fear and confusion among some end users

While the studies are not yet conclusive, it seems that prolonged and continuous exposure to proteins in the latex causes allergic reactions in certain individuals. The typical latex glove manufacturing process reduces these naturally-occurring proteins but does not eliminate them completely

The brand of latex glove we sell, are made from "low-protein" latex to help reduce the chance of a latex allergy. Low-protein latex gloves are made from latex in which most of the skin irritating proteins have been removed.

Latex allergies can be a serious, potentially life threatening health issue. Those who may be sensitive to latex should not use latex. Instead of latex, wear latex-free synthetic gloves such as our disposable nitrile gloves.
